         sequences are useful for treating or preventing a MOLX-associated disorder, such as cardiomyopathy, atherosclerosis, disorders related to cell signal processing and metabolic pathway modulation, diabetes and cancer. Additionally, MOLX proteins and coding sequences are useful for preventing and treating a variety of disorders including metabolic disorders, nutritional oedema, chronic and hereditary pancreatitis, obesity, infectious disease, anorexia, neurodegenerative disorders, haematopoietic disorders and various dyslipidaemias, metabolic syndrome Nalzheimer's disease, Parkinson's disease, Etroke, immune disorders, haematopoietic disorders and various dyslipidaemias, metabolic syndrome Nand wasting disorders associated with chronic diseases and cancers, cardiac disorders, hypertension, hypercalcamia, cirrhosis, angiogenesis and wound healing, trauma, glomerulonephritis, hyper and hypothyroidism, multiple sclerosis, lung diseases including asthma, Crohn's disease, sclerosis, lung diseases including asthma, Crohn's disease, sclerosis, autoimmune diseases, developmental disorders and neural tube

                                                                                                                                                                                                                                                 The invention relates to modulating the production of interferon (IFN)-gamma in a CD8plus+ cell. The method involves contacting a CD8+ T cell with an agent that modulates the expression and/or activity of T-bet. The present sequence represents a RT-PCR primer used in real time quantification of IFN-gamma transcripts
                                                                                                                                                                                                                                                                                                                                            Modulating the production of interferon-gamma in a CD8+ cell by contacting a CD8+ T cell with an agent that modulates the expression and/or activity of T-bet.
                                                                                                                                                                                                                                                                                                                                                                                              WPI; 2003-513767/48.

                                                                                                                                                                                               a microarray of polynucleotides or polypeptides, and selecting polynucleotides or polypeptides that predict the sensitivity or resistance of cells associated with a disease state by using the expression pattern of the microarray. The polynucleotides and polypeptides have cytostatic activities, and can be used in gene therapy. The polynucleotides and polypeptides are useful in predicting the activity of compounds that interact with protein tyrosine kinases and/or protein tyrosine kinase pathways. These may be used in determining drug sensitivity in patients to allow the development of individualized genetic profiles which aid in treating diseases and disorders (e.g. cancer) based on patient response at a molecular level. The present sequence is used in the exemplification of the present invention.

Also described: (1) predicting whether a compound is capable of CC modulating the activity of cells, comprising obtaining a sample of cells, CC modulate the activity of the cells, comprising bataining a sample of cells, CC correlate with compound sensitivity or resistance of cells associated with a disease state, and (3) identifying polymucleotides and CC with a disease state, and (3) identifying polymucleotides and CC polypeptides that predict compound sensitivity or resistance of cells associated CC with a disease state, compounds sensitivity or resistance of cells associated CC cell lines to one or more compounds, analysing the expression pattern of CC amicroarray of polymucleotides or polypeptides, and selecting CC amicroarray of polymucleotides or polypeptides, and selecting CC polymucleotides or polypeptides that predict the sensitivity or resistance of cells associated with a disease state by using the compounds that incroarray. The polymucleotides and polypeptides in pattern of the microarray. The polymucleotides and gene therapy. CT polymucleotides and polypeptides are useful in predicting the compounds that incroarct with protein tyrosine kinases and/or CC polymucleotides and polypeptides are useful in determining drug sensitivity in pattents to allow the development of individualized connect) based on patient response at a molecular level. The present invertion
                                                                                                    Matches
                                                                                                                                                 Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 polymicleotides or polypeptides whose expression pattern is predictive the response of cells to treatment with a common attern is predictive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New polynucleotides and polypeptides compounds that interact with protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      18-JAN-2002; 2002US-0350061P
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     17-JAN-2003; 2003WO-US001981

The method involusing a nucleotide sequence which modulates synthesis of maize caffeic acid 3-0-methyltransferase (COMT), encoded by ACC00262. The maize produced by the method of the invention is useful as animal fodder. The present PCR primer was used in the construction of COMT transformation vectors which were used in an example from the invention

The DNA and protein sequences of the invention are useful for treating or preventing a MOL-associated disorder, such as: cardiomyopathy, atherosclerosis, disorders associated with cell signal processing and metabolic pathway modulation, or diabetes. The DNA and protein sequences are also useful for the treatment of: cancer, stroke, Huntington's disease, epilepsy, anxiety, pain, hypercholesterolaemia, obesity, hypertension, Crohn's disease, systemic lugus erythematosus, viral infections, bacterial infections, parasitic infections, hyperthyroidism, hyperthyroidism, von Hippel-Lindau syndrome, Alzheimer's disease, tuberous sclerosis, hypercalcaemia, or cerebral paley. The present DNA sequence was used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 21
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New MOLX polypeptides and polynucleotides, useful in gene therapy, particularly for treating or preventing e.g. cardiomyopathy, atherosclerosis, diabetes, adenoma, brain tumor, breast cancer, prostate cancer, stroke or pain.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention relates to a novel method for analysing chemically modified macromolecules. Specifically, it refers to a high throughput method for the parallel analysis of many potential sites of chemical modification (e.g. methylation) in DNA. The present invention describes treating the DNA with one or more chemical reagents that result in different base sequences depending upon the presence or absence of the modification of interest. Accordingly, a device comprising an array of probes is provided to hybridise with and select the altered DNA sequences that comprise the modifications of interest such as a CpG island. In particular, this invention refers to analysing the methylation pattern of a region of the promoter for the tumour suppressor gene pl6 from two human lung tumour cell lines H69 and H1618. This oligonucleotide sequence is a human DNA probe used to immobilise CpG methylated DNA of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                       ethnic origin determination; polymorphic site determination; Y chromosome; paternity testing; forensic; diagnosis; non-recombining region; human; NRY; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   NRY polymorphism detection primer #290.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   different base sequences,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                #XFFFFX#X5555555555555555555555555555
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention describes a method of determining the ethnic origin of a comprising obtaining a nucleic acid sample from the male, and identifying at least two polymorphic markers in the nucleic acid sample cidentifying at least two polymorphic markers in the nucleic acid sample indicative of the ethnic origin of the male, using at least one primer pairs given in the specification. Also described is a method of: identifying polymorphic sites in a nucleic acid; a kit for determining the ethnic origin of an individual; determining the ethnic origin of an individual; determining the ethnic origin of an isolated nucleic acid segment of a human y chromosome comprising at least 10 contiguous bases including at least 10 contiguous bases including at least need to primer pairs for amplifying polymorphic regions of the y chromosome comprising at least 10 contiguous bases including at least one of the polymorphic sites given in the specification; nucleic acid primer pairs for amplifying polymorphic regions of the y chromosome comprision in the specification; and determining the paternity of a human male conditional. The method is useful for determining the ethnic origin of a midividual. The method is useful for determining the ethnic origin of a conditional regions a primer used to detect polymorphisms in the non-try.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

The invention describes a method of determining the ethnic origin of a male comprising obtaining a nucleic acid sample from the male, and identifying at least two polymorphic markers in the nucleic acid sample indicative of the ethnic origin of the male, using at least one primer pair from the primer pairs given in the specification. Also described is a method of: identifying polymorphic sites in a nucleic acid; a kit for determining the ethnic origin of an individual; determining the ethnic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC The invention describes a method of determining the ethnic origin of a CC identifying at least two polymorphic markers in the nucleic acid sample conditions at least two polymorphic markers in the nucleic acid sample CC indicative of the ethnic origin of the male, using at least one primer CC pair from the primer pairs given in the specification. Also described is CC a method of: identifying polymorphic sites in a nucleic acid; a kit for CC determining the ethnic origin of an individual; determining the ethnic CC origin of a human male individual; an isolated nucleic acid segment of a human Y chromosome comprising at least 10 contiguous bases including at CC least one of the polymorphic sites given in the specification; nucleic CC acid primer pairs for amplifying polymorphic regions of the Y chromosome CC individual. The method is useful for determining the ethnic origin of a cC male, for paternity testing, for forensic studies or for diagnosis. This sequence represents a fragment of the non-recombining region of the human CC Y chromosome (NRY) comprising a polymorphism that can be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Best Loc

                         male comprising obtaining a nucleic acid sample from the male, and identifying at least two polymorphic markers in the nucleic acid sample indicative of the ethnic origin of the male, using at least one primer pair from the primer pairs given in the specification. Also described is a method of: identifying polymorphic sites in a nucleic acid; a kit for determining the ethnic origin of an individual; determining the ethnic origin of an individual; determining the ethnic origin of a human male individual; an isolated nucleic acid segment of a human Y chromosome comprising at least 10 contiguous bases including at least one of the polymorphic sites given in the specification; nucleic acid primer pairs for amplifying polymorphic regions of the Y chromosome given in the specification; and determining the paternity of a human male individual. The method is useful for determining the ethnic origin of a male, for paternity testing, for forensic studies or for diagnosis. This
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            origin of a human male individual; an isolated nucleic acid segment of a human Y chromosome comprising at least 10 contiguous bases including at least one of the polymorphic sites given in the specification; nucleic acid primer pairs for amplifying polymorphic regions of the Y chromosome given in the specification; and determining the paternity of a human male individual. The method is useful for determining the ethnic origin of a male, for paternity testing, for forensic studies or for diagnosis. This sequence represents a primer used to detect polymorphisms in the non-recombining region of the human Y chromosome (NRY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Determining the ethnic origin of a male by obtaining a nucleic acid sample from the male and identifying at least two polymorphic markers the nucleic acid sample indicative of the ethnic origin of the male.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ethnic origin determination; polymorphic site determination; Y chromosome; paternity testing; forensic; diagnosis; non-recombining region; human; NRY; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Oefner PJ, Underhill PA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              01-NOV-2001; 2001US-00002623
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Homo sapiens

The invention enables the detection of a single nuclectide polymorphism in a human gene. The present sequence represents a primer of the invention.
                      Novel human polypeptide MOL3 PCR primer #1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention describes an isolated molecule (MOLX) polypeptide. The MOLX CC polypeptide, MOLX nucleic acid and antibody are useful for treating, a preventing or alleviating a MOLX-associated disorder or a pathological CC state in a subject, particularly a human. In particular, the disorder is cardiomyopathy, atherosclerosis, diabetes, or a disorder related to cell CC signal processing and metabolic pathway modulation. The MOLX polypeptide and nucleic acid are also useful for diagnosing the presence of or CC predisposition to a disease associated with altered levels of MOLX, CC particularly cancer. The MOLX nucleic acid and polypeptide are especially useful in the manufacture of a medicament for therapeutic or prophylactic CC applications for disorders associated with aberrant MOLX expression or CC tuberous sclerosis, hypercalcemia, Parkinson's disease, Huntington's CC disease, carebral palsy, epilepsy, Lesch-Nyhan syndrome, multiple CC sclerosis, ataxia-telangiectasia, leukodystrophies, addiction, anxiety, CC bowel disease, infertility, hypertension, scleroderma, hemophilia, CC pancreatitis, autoimmune disease, asthma, arthritis, immunodeficiencies, CC disease, infertility, hypertension, scleroderma, hemophilia, CC pancreatitis, autoimmune disease, asthma, arthritis, immunodeficiencies, CC disease. The DNA encoding the protein is useful in gene therapy for treating the above conditions. This sequence represents a primer used in the isolation of DNA encoding a novel human MOLX polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches

The sequence of the invention has sequence homology to rat myotonic dystrophy kinase-related Cdc42 binding kinase (MRCK). The invention may be useful for diagnosing, prognosing, and treating kinase-related diseases, preferably diseases associated with aberrant expression of MRCKI The present sequence is that of a short inhibitory (siRNA) sequence which is targeted towards the human MRCKI gene and which is related to the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                             (AMHP) WYETH.

nucleic and the

novel human protein

sequence,

to a novel isolated polynucleotide comprising the human MRCK1 gene located at position 11q1: otein kinase MRCK1 encoded by it. The sequence

at position 11q13, it. The sequence of

얁 ø

Sequence 21

The invention may be useful for diagnosing, prognosing, and treating kinase-related diseases, preferably diseases associated with aberrant expression of MRCKI. The present sequence is that of a DNA sequence which is part of the human MRCKI gene which may be a target for a short inhibitory (eiRNA) sequence and which is related to the invention. Note: The sequence data for this pattent did not form part of the printed specification but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                            This invention relates to a novel isolated polynucleotide comprising a nucleic acid sequence, the human MRCKI gene located at position 11q13, and the novel human protein kinase MRCKI encoded by it. The sequence of the invention has sequence homology to rat myotonic dystrophy kinase-related Cdc42 binding kinase (MRCK). The invention may be useful for diagnosing, prognosing, and treating kinase-related diseases, preferably diseases associated with aberrant expression of MRCKI. The present sequence is that of a short inhibitory (siRNA) sequence which is targeted towards the human MRCKI gene and which is related to the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (AMHP) WYETH.

                                                                                                                                                                                                                                                                        This invention relates to a novel isolated polynucleotide comprising a nucleic acid sequence, the human MRCKI gene located at position 11q13, and the novel human protein kinase MRCKI encoded by it. The sequence of the invention has sequence homology to rat myotonic dystrophy kinase related Cdc42 binding kinase (MRCK). The invention may be useful for disposing, prognosing, and treating kinase-related diseases, preferably diseases associated with aberrant expression of MRCKI. The present sequence is that of a DNA sequence which is part of the human MRCKI gene which may be a target for a short inhibitory (siRNA) sequence and which is related to the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (AMHP) WYETH. (LIUW/) LIU W. (WULL/) WU L.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention relates to a novel isolated polynucleotide comprising a nucleic acid sequence, the human MRCKI gene located at position 11q13, and the novel human protein kinase MRCKI encoded by it. The sequence of the invention has sequence homology to rat myotonic dystrophy kinase-related Cdc42 binding kinase (MRCK). The invention may be useful for diagnosing, prognosing, and treating kinase-related diseases, preferably diseases associated with aberrant expression of MRCKI. The present sequence is that of a DNA sequence which is part of the human MRCKI gene which may be a target for a short inhibitory (siRNA) sequence and which is related to the invention. Note: The sequence data for this pattent did not form part of the printed specification but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New human protein kinase MRCK1 with 65% sequence homology to dystrophy kinase-related Cdc42-binding kinase (MRCK), useful diagnostics and as a drug target.

Cytomegalovirus target sequences for enzymatic RNA molecules. The RNA molecules are complementary to a substrate binding region in the specified gene target. They also have enzymatic activity, in that they specifically cleave RNA in the target. The ERMs interfere with viral replication and therefore have anti-viral properties. They can be used to attenuate viruses to be used in vaccines. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 25-MAR-2003 to correct PR field.)

                                                                                                                                                                                                                                                                                                                                             Sequences were determined from the ends of chromosome 11-specific cosmids by automated sequencing without intermediate subcloning. A sample of 371 DNA sequence fragments were determined and of these, 277 were suitable for STS primer prediction by computer analysis (using the "primer" program available from E.Lander, MIT). The STSs and cosmids were mapped by in situ hybridisation, somatic cell hybrid analysis or both. Using this method, 370 STSs specific for human chromosome 11 were generated and most of them were regionally mapped. This procedure illustrates a novel method for sequencing complex genomes designated "sequence sampled mapping". The sequence sampled mapping method is useful for the completion of high density sequence-based maps, and ultimately, for the complete sequencing of genomic DNA directly from cosmid clones. See AAQ82001-082706 for STS primers. (Also see AAQ91325-58). (Updated on 25-MARR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequencing complex genomes, present as fragments in a cosmid library -sequencing end-specific nucleotides of each clone then correlating with spatial relationship of cosmid, esp. for mammalian chromosomes.

Such markers can be used in the construction of allele-specific primers and probes for amplification or hybridisation, e.g. to determine common or disparate ancestry between 2 or more plants, to monitor the genetic contribution of an ancestral plant, to trace the progeny of proprietary plants, in certification of a hybrid plant or to identify the progeny of a back-crossed plant with an ancestral plant

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  members of a family of transcriptional regulator genes containing a bromodomain (BAZ, Bromodomain with Atypical Zinc finger) which are expressed specifically in testis tissue and also in certain tumour lines. Transgenic cells may be used for the preparation of the BAZ1-alpha, BAZ1-beta, BAZ2-alpha and BAZ2-beta proteins. These proteins can be used in the treatment of concer and other proliferative disorders, and in screening of compounds for their binding ability to the expression products (e.g. for use as drugs by modulation of transcriptional
The present invention describe a method for detecting target hepatitis Grain (HGBV) nucleic acid (THN) in a test sample (T) suspected of containing HGBV. The method involves reacting (T) with a HGBV polynucleotide probe (I) containing 15 contiguous nucleotides, and which selectively hybridises to the HGBV genome or its full complement, and detecting the complex that contains THN, indicating the presence of
                                                                                                                     Detecting target hepatitis GB virus nucleic acid in a test sample suspected of containing HGBV comprises reacting the test sample the polynucleotide probe and detecting the complex that contains target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 22

                                      PCR primers AAA15054-55 were used to produce deletion mutants of the invasin protein TpaC. The specification describes a method for the production of recombinant invasin proteins which are superior to presently approved adjuvants due to their low toxicity, their ability to stimulate both peripherals and mucosal immune response, and ease of production. The invasin protein may be used as a vaccine and as an adjuvant for the prevention of diseases such as shigellosis, salmonellosis and diseases caused by enteroinvasive E. coli, and in stimulating the immune system of immuno-compromised individuals. The invasin protein is also useful for intracellular delivery of therapeutic and diagnostic agents, and to stimulate immune response by cells in the object of the protein can be mixed with antigens of biological or other invasin protein can be mixed with antigens of biological or
                                                                                                                                                                                                                                                                                     New purified recombinant invasin proteins IpaC and SipC adjuvant and vaccine against shigellosis, salmonellosis enteroinvasive Escherichia coli.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         target HGBV. The method is used for detecting target HGBV nucleic acid in the test sample suspected of containing HGBV and for characterisation of newly ascertained etiological agent mon-A, non-B, non-C, non-D and non-E hepatitis causing agents collectively termed as hepatitis GB virus.

AAA55270 to AAA55489 and AAB08985 to AAB09480 represent nucleotide and protein sequences used in the exemplification of the present invention.

PCR primers AAA96313-15 were used to amplify cDNA encoding a secreted or transmembrane polypeptide. The specification describes polypeptides designated pR01484, PR04334, PR01122, PR01889, PR01890, PR01891, PR01895, PR04351, PR04357, PR04405, PR04356, PR04352, PR04380, PR04354, PR04408, PR05737, PR04425, PR05990, PR06030, PR04424, PR04422, PR044210 and PR04429, PR01889 polypeptide is useful for diagnosing tumour in a mammal. The polypeptides, their agonists and antagonists are useful treating a condition associated with expression or activity of the polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Secreted protein; transmembrane protein; PRO1484; PRO4334; PRO1122; PRO1889; PRO1889; PRO1887; PRO4185; PRO4353; PRO4357; PRO4405; PRO590; PRO4352; PRO4380; PRO4354; PRO4408; PRO5737; PRO4425; PRO5990; PRO619R04424; PRO4420; PRO4430; PRO4499; tumour; obesity; diabetes; insulinemia; kidney disorder; Bergers disease; nephropathy; Schonlein-Henoch purpura; celiac disease; dermatitis herpetiformis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Conditions treated include obesity, diabetes or hyper-or hypo-
insulinemia. The polypeptides are capable of inducing proliferation of
mammalian kidney mesangial cells and are therefore useful for treating
kidney disorders associated with decreased mesangial cell function such
as Bergers disease or other nephropathies associated with Schonlein-
Henoch purpura, celiac disease, dermatitis herpetiformis or Crohns
disease. The nucleic acids may be used to generate transgenic animals for
use in development and screening of therapeutically useful reagents and
also for chromosome identification and tissue typing
                                                                                                                                                                                                                                                                                                      The invention relates to a method for preparing Ni-containing superoxide dismutase (NiSOD) from Streptomyces coelicotor. Streptomyces lividans. The invention also discloses a method for producing a strain of streptomyces lividans in which the gene encoding NiSOD (sodN) is deleted. Sequences ADK68393-ADK68394 represent FCR primers used to amplify a
                                                                                                                                                                                                                            Sequence 22
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WPI; 2000-547509/50.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                30-JAN-1998;

The method is useful in gene therapy of telomere length-related diseases such as melanoma, liver cancer, breast cancer, bladder cancer and brain cancer. The present sequence is that of a Mrell related PCR primer of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to control of telomere length in a cell by modifying the physiological activity of the Mrell protein in the cell, by transformation of the cell with DNA encoding a foreign Mrell protein which may be modified in the C-terminal and/or nuclease domain. The method is useful in gene therapy of telomere length-related diseases such as melanoma, liver cancer, breast cancer, bladder cancer and brain cancer. The present sequence is that of a Mrell related PCR primer of the invention. Note: The present sequence is given as SEQ ID NO 10 in the disclosure but differs from that given as SEQ ID NO 10 in the sequence listing (AAH75566) and is identical to that given as SEQ ID NO 12

CC SNP Flanking sequence, the SNPE primer is used as a genotyping primer.

CT The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The coligonucleotides are useful for determining the presence, absence or clidentity of a SNP and for genotyping nucleic acid samples, for e.g. to cases by association analysis the genotype of an individual or group of clidatiduals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. cagammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular cystrophy, familial hypercholesterolaemia, polycystic kidney disease, consteogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial confidences, including, rheumatoid arthritis, multiple sclerosis, concer, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and contention system diseases are primer specific secretics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         primer extension (SNPB) primers, and the sequences of regions flanking sites of single nucleotide polymorphisms SNPB. The present invention includes kits for determining the presence or absence of a SNP, using oligonucleotides of the invention. The PCR primers are used to amplify
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequences AAH37205 - AAH40944 represent

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ត្តត្តត្តត្តន្ត¥&
                               The present invention describes a method of arraying genome clones. The cmethod comprises: (a) clones of the genomic libraries contained in cmethod comprises: (a) clones of the genomic libraries contained in cmultiwell plates numbered for discrimination are mixed in each of the cc multiwell plates; (b) a primer designed based on the chromosome marker (c) a signal corresponding to the marker is detected from the resultant camplified product to specify the discrimination Nos. of the multiwell confished product to specify the discrimination Nos. of the multiwell confished product to specify the discrimination Nos. of the multiwell confished product to specify the discrimination Nos. of the multiwell confished containing the clones having said marker sequence; (d) the order confished containing the clones having said marker sequence; (d) the order confished containing the clones in the multiwell plates of the specified confished confished discrimination Nos. to array the multiwell confished confished discrimination Nos. to array the multiwell confished from the detected clones are cultured and the confished product; (h) the clones in the multiwell constituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABL42957 to ABL45322 represent por human chromosome 21q22.1, which are specified for human chromosome 21q22.1, which are specified for use in the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ફ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

The invention also comprises a microbe which has been transformed with the gene encoding the iron-binding aerotolerant protein. The microbe of the invention is useful in the preparation of milks of long appreciation period. The present nucleotide sequence represents an S. mutans iron-binding aerotolerant protein-related oligonucleotide (dpr1)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 4; Page 51; 528pp; Japanese.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Arraying genome clones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       10-MAR-2000; 2000JP-00066716

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC (MDR1), lactotransferrin (LTF), multidrug resistance 1 (C (MDR1), lactotransferrin (LTF), multidrug resistance associated protein 3 (C (MRP3), orphan nuclear receptor (NR112), or acetylcholine muscarinic C receptor 1, 2, 3, 4, or 5 (CHMR1, CHMR2, CHMR3, CHMR4 or CHMR5) sequence. CC genetic linkage markers for locating and characterising the genes that CC are responsible for specific traits within the genome and eventually CC identifying the genes responsible for a variety of disorder-related C traits as a result of their e.g., overexpression, constitutive CC expression, mutation or underexpression, which may be used in diagnosing CC polymorphic sequences contained in CYP4501A1, CYP4501A2, CYP4502E1, CC ARNT, EPHX2, GST12, NNMT, NQO2, NR112, STM, UGT2B4, UGT2B7, UGT2B15, AHR, CC MDR1 and/or MDR3 are useful for screening individuals for altered drug metabolism. The polymorphic sequences contained in CYP4501A1, CYP94501A2, CYP94501A2, CC AHR, MDR1 and/or MDR3 may also be used to screen individuals for cusceptibility to cancer. Polymorphic sequences in ADRB1 or CHMR2 are used to screen for altered cardiovascular function, in COX2 for altered central nervous system function, in FLAP and HNMT for altered munological or haematological function, in CHMR3, CHMR4 or CHMR5 for altered central and comparation of the function. The present sequence represents a cc polymorphic nervous system function. The present sequence represents a cc polymorphic nervous system function. The present sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

The methods and compositions of the present invention are useful for the diagnosis and treatment of disorders associated with the PRO polypeptides, such as diabetes, obesity and hypoinsulinaemia. The present sequence represents a human secreted and transmembrane PRO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated, secreted and transmembrane PRO polypeptides and encoding nucleic acids, useful for the diagnosis and treatment of disorders sucl as diabetes, obesity and/or hypoinsulinemia.

The present invention relates to the isolation of novel human PRO polypeptides, and the polynucleotide sequences encoding them. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides and polynucleotides are useful in diagnosing or treating noting in the properties and polynucleotides are useful in diagnosing or treating noting. In the properties are sequences, septic shock, rheumatoid arthritis, graff-versus-host disease, stroke, cardiac ischaemia, psoriasis, inflammatory bowel disease or asthma. The PRO polynucleotide sequences may be used as hybridisation probes in chromosome and gene mapping, or in generating antisense RNA and DNA. They are also useful in preparing PRO polypeptides, in assays to identify other proteins or molecules involved in binding reaction, to generate transgenic animals or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Desnoyers

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       knockout animals, which in turn are useful in the development and screening of therapeutically useful reagents, for chromosome identification, and tissue typing. The PRO polypeptides and nucleic acid molecules are also useful in gene therapy, and as molecular weight markers for protein electrophoresis purposes. Anti-PRO antibodies may be used in diagnostic assays for PRO polypeptides, or for the affinity purification of the polypeptides from recombinant cell culture or natural sources. The present sequence represents a PCR primer used in the examples of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; primer; ss; inflammatory disease; organ failure; atherosclerosis; cardiac injury; infertility; birth defect; premature aging; AIDS; cancer; differentiation disorder; cell adhesin disorder; skin disorder; PCR; neural receptor disorder; diabetic complication; tissue typing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             26-DEC-2001;

                                                                                                                                                                                                                                            The invention relates to an isolated nucleic acid that encodes a PRO polypeptide. The nucleic acids and polypeptides are useful for treating inflammatory diseases, organ failure, atheroselerosis, cardiac injury, infertility, birth defects, premature aging, acquired immunodeficiency syndrome (AIDS), cancer, differentiation disorders, cell adhesin disorders, neural receptor disporders, skin disorders or diabetic complications. The nucleic acids are useful as hybridisation probes, in chromosome and gene mapping and in generating antisense RNA or DNA. The polypeptides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. Both are useful in tissue typing. The present sequence represents a PCR primer used to isolate a cDNA encoding a PRO polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  as PRO,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (2) screening a set of protein moleties for molecules that interact with one or more proteins; and (3) simultaneously determining the relative properties of members of a set of protein moleties. The protein array can be used for determining the phenotype of a naturally occurring variant of a DNA sequence of interest. The protein array is useful for drug discovery, pharmacogenomics and diagnostics. The protein array allows the parallel analysis of closely related proteins with a sensitivity that is at least comparable to existing methods, if not better, with small volumes of potentially expensive ligands, and in a quantitative, comparative functional analysis manner not previously possible. ACF06000 to ACF06056 and ABR81975 to ABR82026 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                         Secreted and transmembrane protein related primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 22

2003-615764/58.

Novel isolated secreted and transmembrane polypeptides, designated as polypeptides e.g. PRO1484, PRO4334 and PRO1122, useful for inhibiting tumor cell growth, and for preparing medicaments for therapeutic use. PRO

Example 9; Page 85; 201pp; English.

The invention describes an isolated secreted and transmembrane PRO CC polypeptide (I), having at least 80% identity to or scoring at least 80% compositives when compared to, a sequence (S1) comprising 246, 440, 197, 97, CC 273, S71, 209, 888, 502, 310, 251, 800, 507, 248, 223, 134, 136, 468, CC specification. An anti-(I)-antibody is useful for determining the CC specification. An anti-(I)-antibody is useful for identifying a compound CC capable of inhibiting the expression and/or activity of (I). (I) and the CC capable of inhibiting the expression and/or activity of (I). (I) and the CC capable of inhibiting the growth of tumour cells, and for CC the preparation of a medicament useful in the treatment of a condition CC which is responsive to (I) or the antibody. A polynucleotide (II) CC encoding (I) is also useful for isolating full-length PRO cDNA for CC generating transgenic animals or knock-out animals, which are, in turn, CC are useful in the development in the screening of therapeutically useful creagents, and in gene therapy. PRO is useful in assays to identify other CC proteins or molecules involved in binding interactions and for screening chemical conditions or agonists of binding interactions and for screening chemical conditions or agonists of binding interactions and for screening chemical conditions or screening chemical conditions or agonists of binding interactions and for screening chemical conditions or screening tissue typing and for chromosome identification.

The invention relates to an isolated, secreted and transmembrane complyapetide, termed PRD polypeptide, PRO having at least 80 % sequence complete the specification of the 23 100-900 residue maino acid sequences, given complete the specification of the 23 100-900 residue and composited under any one of the ATC accession numbers given in the specification. Also included are an isolated nucleic acid molecule having care the sequence of the ATC accession numbers given in the specification (or a nucleotide sequence of 23 400-3500 nucleotide sequence encoding PRO, a chilary to a nucleotide sequence encoding PRO, a chilary sequence of 23 400-3500 nucleotide sequence encoding PRO, a chilary and peptide, a sequence encoding PRO, a chilary and provide, a sequence encoding PRO, a chilary and provide and an anti-PRO antibody. PRO is useful for identifying CC antigonists of anti-provide anti-provide as the rapeutic agent. PRO is anti-gonists or anti-provide anti-provide as the rapeutic agent. PRO is expressing those markers. PRO is also useful for recombinantly expressing those markers. PRO is also useful for recombinantly capital subject the artificial in assays to identify molecules or proteins which bind to PRO and CC unitiality in this bitors of PRO. PRO nucleic acid is useful for knockout animals which in turn are useful in the development and screening of CC manimals which in turn are useful. In the development and screening of identification, as Schromosome marker, and for the generic analysis of conditional swith genetic disorders, in gene therapy, for chromosome for PCR, and for treating septic shock, PRO or the antibody is useful for the provide shock provide and provide and provide are the provide and provide

The invention relates to an isolated nucleic acid that encodes a PRO polypeptide. The methods and compositions of the present invention are useful for the diagnosis, prevention and/or treatment of inflammation, nephropathies, bone and cartilage disorders, such as arthritis and disorders that affect glucose or free fatty acid (FFA) uptake, such as diabetes, hypoinsulinaemia or hyperinsulinaemia. The PRO polypeptides are also useful as molecular weight markers or for chromosome identification. The PRO genes are useful as hybridiastion probes or for screening libraries of human cDNA, genomic DNA or mRNA. The PRO genes may also be used in gene therapy and antisense therapy. The present sequence is a PCR primer used in the isolation of human PRO cDNA
                                                                                                                                                                                                                                     Sequence 22 BP; 3 A; 9 C; 5 G; 5 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                              The present invention relates to novel polypeptides and nucleic acids encoding them. The methods and compositions of the present invention ar useful for the diagnosis, prevention and/or treatment of inflammation, nephropathies, bone and cartilage disorders such as arthritis and disorders that affect glucose or free fatty acid (FFA) uptake such as diabetes, hypoinsulinaemia and hyperinsulinaemia. The PRO peptides are useful as molecular weight markers and for chromosome identification. The PRO genes may also be used in gene therapy and antisense therapy. The present sequence is a PCR primer used to isolate human PRO cDNA

The invention describes an isolated secreted and transmembrane PRO polypeptide (I) having at least 80% amino acid sequence identity to fully defined sequences of 246, 440, 197, 97, 273, 571, 209, 888, 502, 310, 251, 800, 507, 248, 223, 134, 136, 468, 322, 221, 194, 125 or 339 amino acids as given in the specification. (I) is useful for tissue typing, as molecular weight markers or as therapeutic agents. A polynucleotide (II)
                                                                                                                                                                                                                                                                                                                                               Novel isolated PRO PRO1889, PRO1890, PR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Homo sapiens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                US2003092063-A1
                                                                                                                                                                                                                                                                            Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WPI; 2003-765478/72.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          encoding (I) is useful for chromosome identification, gene therapy, tissue typing or as hybridisation probes in chromosome and gene mapping. PRO1484, PRO1890, PRO1887, PRO4357, PRO4405, PRO5737 and PRO5990 is useful for treating sports injuries and arthritis. PRO1484, PRO1112, PRO1889, PRO4357, PRO4380 and PRO4356 are useful for treating diabetes. PRO4334, PRO4427, PRO4390, PRO1890, PRO1785 and PRO4422 are useful for treating obesity, diabetes or hyper- or hypo-insulinaemia. PRO4352, PRO4354, PRO4408, PRO6030 and PRO4499 are useful for treating thalassaemia. PRO4354, PRO4408, PRO6030 and PRO4499 are useful for treating disease, Schonlein-Henoch purpura, celiac disease, dermatitis herpetiformis or Crohn's disease. This sequence represents a novel human secreted and transmembrane PRO polypeptide associated primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 22

                                                                                                                                                                                                                                                           The present invention relates to the isolation of novel human PRO CC polypeptides, and the polynucleotide sequences encoding them. The PRO CC polypeptides are secreted and transmembrane proteins. The PRO CC polypeptides and polynucleotides are useful in diagnosing or treating CC various bone and/or cartilage disorders (e.g. sports injuries, CC hypo-insulinaemia), obesity, hyper-insulinaemia, haemoglobin-associated with CC disorders (e.g. thalassaemias), kidney disorders associated with CC decreased mesangial cell function (e.g. Berger disease), or other nephropathies associated with Schonlein-Henoch purpura, cellac disease, CC dermatitis herpetiformis or Crohn's disease. The PRO polynucleotide cC mapping, or in generating antisense RNA and DNA. They are also useful in CC preparing PRO polypeptides, in assays to identify other proteins or CC molecules involved in binding reaction, to generate transgenic animals or CC molecules involved in binding reaction, to generate transgenic animals or CC identification, and tissue typing. The PRO polypeptides and mucleic acid CC molecules are also useful in gene therapy, and as molecular weight consecuted in diagnostic assays for PRO polypeptides, or for the affinity purification of the polypeptides from recombinant cell culture or natural courses. The present sequence represents a PCR primer used in the cc examples of the porsent sequence represents a PCR primer used in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              polynucleotide is useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA, and in gene therapy. The polynucleotide may also be used in preparing PRO polypeptides by recombinant techniques, and in generating either transgenic animals or knock-out animals which, in turn are useful in the development and screening of therapeutically useful reagents. This sequence represents a primer used to isolate DNA encoding a novel human secreted and transmembrane PRO proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Twenty three nucleic acids encoding PRO polypeptides, useful .chromosome and gene mapping, in generating antisense RNA and gene therapy.
                                                                                 New protein array comprising a surface having spatially defined locations containing drug metabolizing enzymes, examining gender and ethnicity-related differences in drug metabolism or cytotoxicity of drug

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 22
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention describes 23 nucleic acids encoding human secreted transmembrane PRO polypeptides. The PRO polypeptides and nucleic are useful for the therapeutic treatment of cancerous tumours. The treatment of cancerous tumours.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC act sequentially on a substrate of interest and are derived from one or common drug metabolising enzymes (DMEs). Also described: (1) a method of comaking a protein array; (2) an array made by the method of (1); (3) a cc method of screening a set of protein moieties for molecules which commended in the relative properties of members of a set of protein cc moieties; and (5) a method of expressing and purifying a DME. The protein cc array is useful in examining gender differences in drug metabolism, cc ethnicity-related differences in drug metabolism and toxicity between two cr more mammalian species, e.g. human and rat and cytotoxicity of drug conjunctions, in defining and quantifying metabolism and toxicity of drug conjunctions, in screening of compounds that binds and inhibits individual compounds of interest and the effects of mutation on the activity of a compounds of interest and the effects of mutation on the activity of a conjunction variant of a human cytochrome p450 enzyme, which is used in the properties are the present sequence represents a PCR primer for a conjunction of pathon pathon is used in the properties are properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                     The present invention relates to a method (M1) for obtaining a bifunctional complex. (M1) comprises a display molecule part and a coding part, where a nascent bifunctional complex comprising a chemical reaction site and a priming site for enzymatic addition of a tag is reacted at the chemical reaction site with reactant(s), and provided with respective tag(s) identifying the reactant(s) at the priming site using one or more enzymes. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     part, where a nascent bifunctional complex comprising a chemical react site and a priming site for enzymetic addition of a tag is reacted at chemical reaction site with respectant(s), and provided with respective tag(s) identifying the reactant(s) at the priming site using one or more enzymes. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                      Obtaining bifunctional complex with display molecule and coding part, where bifunctional complex with priming site for adding tag is reacted reaction site with reactants and provided with tag identifying reactants.

                                                                                                                                                                                                                          an individual. The methods are also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatoid archritis, lupus, inflammatory bowel diseases, multiple sclerosis, HIV/AIDS or viral, bacterial or fungal infection. The present sequence represents a primer for a 50 mer oligonucleotide marker for diagnosis and monitoring of allograft rejection and other disorders.
                                                                                                                                                                                                                                                                                                              rejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, in a renotransplant rejection or mechanical organ replacement rejection, in an individual. The method is also useful in assessing the immune status of
